

**Mykhaylo Medvedskyy**

Main astronomical observatory of Ukrainian academy of science

# New external calibration target on 1824

20th Int. Workshop on Laser Ranging

October 9-14, 2016

Potsdam, Germany

# Why do we need calibration

- - The main purpose of the calibration measurement has a systematic delay and its variation during the observation
- - Systematic delay consists of a constant component and a variable component
- - The main reason for changing the delay signal there are external conditions (temperature, humidity, atmospheric pressure), the amplitude of the optical and electrical signal

# TPL-1

## optical switch schemes

- The possibility of the external calibration on 1824
- This telescope is used for one way transmission and receiving of the laser pulse

# The PMT view on corner cube

# The PMT view on corner cube

# The reasons of the new target

- - old was destroyed by unknown persons **twice**
- - old target system has systematic error

Old target was place  
(125m distance)

```

Why?

- A lot of photons from laser beam reflect from dust and optical surfaces come back to receiver! At first time.

# PMT output to CFD

you can see the presence of a constant component of the voltage (about -0.4V) when the signal from the target

The new target  
place

Signal from optical components and target

Telescope optics

target

# The signal after attenuation PMT optical path

The signal after attenuation laser beam

Only target signal!

# RB in 2016

# The main problem of 1824 station is precision!

- solutions:
- - install the event timer;
- -install the high speed PMT;

# Thank you for your attention!

- A lot of thanks Riga & Potsdam teams for technical support!

Thank you for your attention!
